

Biofires Ireland Limited are delighted to announce the recent addition of the new Planika range of Bioethanol fires and stoves to our wide range of stoves and patio fires. Bioethanol fires provide a focal point and a “live flame” ambiance and of course economical, carbon-free heat-on-demand.

The new Planika range combine modern, yet elegant international design with the advanced technology of environmentally friendly, smokeless ethanol based fires. Planika Fires are not only exquisite elements of interior decoration, but most of all they are real fireplaces enhanced by design.

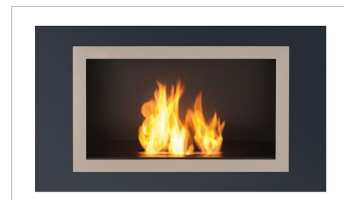

They create an exceptional atmosphere influencing our everyday life. Depending on mood they can stimulate our energy and inspire our potential or they can simply help us relax.

From wall mounted units, free-standing units, double-sided, “double-room” fireplaces through to fireplace inserts, all of our systems are designed to run on bio-ethanol fuel - a renewable “green”, carbon-free liquid fuel, certified for both the user's and the environments safety. Bioethanol is readily available throughout Ireland, it is a very economical heating source and conveniently leaves no residue or ash.

Long fireplaces are designed especially for architects and interior designers. They offer unlimited possibilities for arrangement together with simplicity of use. Fireplace inserts can be made to measure according to a specific project.

The diversity of Biofire forms designed by international design masters emphasize the concept of bio-ethanol fires and allow the introduction of fire into the most sophisticated spaces.

For example, interior models for hotel receptions, foyer areas, spas, conservatories, dining rooms etc and exterior models for hotel entrances, reception room entrances, smoking rooms, etc.
